## Abstract

OBJECT: The present invention has its object for providing a cross tearing laminated film having a good tearing property and directional character of tearing, and low heat-sealing property.

CONSTITUTION: A cross tearing laminated film, which essentially consists of a heat-sealable film layer (A layer) comprising a polymer and substantially cross uniaxial-stretched, and a base film layer (B layer) comprising a polypropylene polymer having melting point higher than the polymer of A layer and substantially cross uniaxial-stretched.
